

([github.com/fodorbalint/OneWayLabyrinth](https://github.com/fodorbalint/OneWayLabyrinth))

"Draw a line that goes through an  $n \times n$  grid (where  $n$  is an odd number), passing through each field once. The line has to start from the field at the upper left corner (1,1) and end at (n,n). At any time it is allowed to move left, right, up or down, and it has to randomly choose between the available fields."

The diagram illustrates a multi-agent environment on a 20x20 grid. Two blue agents are positioned in the upper half of the grid, connected by a horizontal corridor. Each agent has a red 3x3 interaction range. The environment includes obstacles (gray squares) and a goal area (green squares). The agents are facing each other, and the corridor allows them to move towards the goal area.

The question is, is there a single rule or a set of rules that will guarantee you can draw a labyrinth of any size? Or do the rules get infinitely complex?

A 3 x 3 area can only be filled in two ways, like this and mirrored:

1

- A single field next to the live end that is walled from two other sides (either by the border or the line) needs to be filled in the next step. I call it C-shape. The pattern is both mirrored and rotated, so that the empty field is straight ahead. To qualify for this rule, the empty field cannot be the end corner. If there is a C-shape, we don't need to check other rules.

- Movement near the edge: In the example, we cannot step left (3,5), since the (2,5) field is empty.

- A 2 x 3 empty area next to the live end that is walled by three sides (2-3-2 long) will have a future line going through along the walls. At the wall next to the main line, its direction is the opposite of the main line, meaning it will go from (3,2) upwards whereas the main line just took a step downwards. How the middle field will be filled is not yet known. Either the near end (the one the main line will go through first) or the far end can fill it.

- A 2 x 2 empty area next to the live end that is walled by three sides (2-2-2 long) will have a future line going through along the walls. In this example, the far end is already extended by one step as it had only one option to move.

- Future line extension when we step on a future line: The far can be extended if it was 2 distance away from the near end. It can now fill the C-shape.

The same goes with 1 x- and y-distance. A C-Shape is not always created in this case.

If the far end was near the end corner, it has to choose the other empty field.

- Future line extension when stepping away: If there was a near end where the main line was in the previous step, it now may have only one choice to move, so it can be extended.

- Future line connection: In this case, the line being stepped on extends until the far end has two options. (When the end corner is one of them, it has to be removed.) Then, the line on the left extends and now has no other option than to connect to the line on the right.

- When we are two distance away from the edge, we need to check if stepping towards it is possible.

It is because if we do so, an enclosed area is created, with one way to go out of it. If that area has an impair amount of cells, it cannot be filled, so we cannot take that step.

The explanation is simple: Imagine if the table was a chess board. In order to step from white to black, you would need to take an impair amount of steps - the color changes at every step. Here, the entry of the area would be (4,3) and the exit (5,3). An impair amount of steps means pair amount of cells.

In the example, you can also say that we cannot step right, because there is a future line start 2 to straight and an end 2 to straight and 2 to right. On 7 x 7, there will be examples where this is the rule we have to apply, because area counting is not getting triggered:

But let's start with the simpler rules:

- Future line extension: When a near end is at 2 distance left or right from the live end, it will fill the field between them if the live end steps elsewhere. That's what happened in the 5 x 5 example above before the line failed.

In other situations, there is a 1-thin future line next to the live end that can be extended if its far end is at the corner. Though disabling this rule does not affect the total amount of walkthroughs on a 7 x 7 grid, I chose to include it in the project on the basis that if a future line can be extended, we should do it. It can make a considerable difference. The left picture is without the rule, the right is with it.

- Just like moving near the edge, we need to disable some fields if we are approaching an older section of the main line. In order to determine on which side the enclosed area is created, we need to examine the direction of the line at the connection point.

The gray square means empty field. When the field 2 to straight is taken, its left or right side will be taken too.

These will only be checked if one of the above 4 situations were not present. (They have to be mirrored, too.)

Likewise, these will be not be checked if the previous rules were true.

And when none of the 1-distance situations are valid, we check for 2-distance.

Impair areas can now happen inside the grid, not just on the edge, and the following rules have to be applied:

The procedure is similar to the the straight 2-distance rule. The only difference is that we count the area starting and ending at the marked fields. In the first, the direction of the circle is left, in the second right.

Besides mirroring them, we also have to rotate them both counter-clockwise and clockwise.

But we do not need 12 of such rules. Taking the first, the live end cannot come from the left, because the area parity was already checked in the previous step, and now we just added 2 fields to it. It can come from the right, and then there is naturally only one field we might have to disable.

Here are the representations of the two scenarios for the left side:

Similarly to the straight rules, these will only apply if there is no wall 2 distance to the left or right. Let's construct these preconditions.

We are not finished. Did you notice the example above is not covered by these rules? We have to move the taken fields 1 and 2 steps to the side, both in straight and side direction.

When any of the straight 2-distance rules are present, we don't need to check the side rules or the area created with the border. This is not entirely proven, but take these 9 x 9 examples:

And these are the rest of the rules:

- This is what I started the 7 x 7 introduction with. I will call it Future L.

- And these are the remaining size-specific rules. Future 2 x 2 Start End, Future 2 x 3 Start End and Future 3 x 3 Start End.

The program, in fast mode, can run through approximately 100 cases per second, depending on your computer speed. This enables us to discover all 7 x 7 walkthroughs, which is 111 712.

It is equal to what is described in the Online Encyclopedia of Integer Series (Number of simple Hamiltonian paths connecting opposite corners of a  $2n+1 \times 2n+1$  grid).

As the sizes grow, it will be impossible to run through all cases with one computer in a reasonable time. In order to discover the patterns, we need to run the program randomly.

Is it possible to develop an algorithm that works for all sizes? The edge-related and area-counting rules are universal, but the size-specific rules get more and more complex. Can you define them with one statement?

I have made statistics about how many random walkthroughs you can complete on different grids using the 7 x 7-specific and the universal rules before running into an error. Based on 1000 attempts, here are the results:

9: 19.5  
11: 5.7  
13: 2.6  
15: 1.2  
17: 0.7  
19: 0.4  
21: 0.2

A 10x10 grid with a background of red and blue regions. A black path starts at the top-left corner (0,0) and ends at the bottom-right corner (9,9), following the outer boundary of the grid. A blue path starts at the top-left corner (0,0) and ends at the bottom-right corner (9,9), following a more complex route that visits several blue regions. The blue path starts at (0,0), goes right to (1,0), down to (1,1), left to (0,1), down to (0,2), right to (0,3), down to (0,4), right to (1,4), down to (1,5), left to (0,5), down to (0,6), right to (0,7), down to (0,8), right to (1,8), down to (1,9), right to (2,9), down to (2,10), right to (3,10), down to (3,11), right to (4,11), down to (4,12), right to (5,12), down to (5,13), right to (6,13), down to (6,14), right to (7,14), down to (7,15), right to (8,15), down to (8,16), right to (9,16), down to (9,17), right to (10,17), down to (10,18), right to (11,18), down to (11,19), right to (12,19), down to (12,20), right to (13,20), down to (13,21), right to (14,21), down to (14,22), right to (15,22), down to (15,23), right to (16,23), down to (16,24), right to (17,24), down to (17,25), right to (18,25), down to (18,26), right to (19,26), down to (19,27), right to (20,27), down to (20,28), right to (21,28), down to (21,29), right to (22,29), down to (22,30), right to (23,30), down to (23,31), right to (24,31), down to (24,32), right to (25,32), down to (25,33), right to (26,33), down to (26,34), right to (27,34), down to (27,35), right to (28,35), down to (28,36), right to (29,36), down to (29,37), right to (30,37), down to (30,38), right to (31,38), down to (31,39), right to (32,39), down to (32,40), right to (33,40), down to (33,41), right to (34,41), down to (34,42), right to (35,42), down to (35,43), right to (36,43), down to (36,44), right to (37,44), down to (37,45), right to (38,45), down to (38,46), right to (39,46), down to (39,47), right to (40,47), down to (40,48), right to (41,48), down to (41,49), right to (42,49), down to (42,50), right to (43,50), down to (43,51), right to (44,51), down to (44,52), right to (45,52), down to (45,53), right to (46,53), down to (46,54), right to (47,54), down to (47,55), right to (48,55), down to (48,56), right to (49,56), down to (49,57), right to (50,57), down to (50,58), right to (51,58), down to (51,59), right to (52,59), down to (52,60), right to (53,60), down to (53,61), right to (54,61), down to (54,62), right to (55,62), down to (55,63), right to (56,63), down to (56,64), right to (57,64), down to (192,199), down to (192,200), right to (193,200), down to (193,201), right to (194,201), down to (194,202), right to (195,202), down to (195,203), right to

The diagram shows a 10x10 grid. A red-shaded region represents a complex shape. Inside this red region is a white-shaded area. A blue-shaded region is also present, partially overlapping the white area. A black line traces the boundary of the red region, showing a complex, non-convex path. A green-shaded region is also visible, partially overlapping the blue and white areas.

When generating code from the drawing, we have to check on which side the enclosed area was created. Here, we want it to be on the right side, so there are two cases to look at:

- 13      14

A 10x10 grid with a path of red and blue squares. The path starts at the top-left corner (0,0) and ends at the bottom-right corner (9,9). The path is composed of red and blue squares. The red squares are at (0,0), (0,1), (0,2), (0,3), (0,4), (0,5), (0,6), (0,7), (0,8), (0,9), (1,0), (1,1), (1,2), (1,3), (1,4), (1,5), (1,6), (1,7), (1,8), (1,9), (2,0), (2,1), (2,2), (2,3), (2,4), (2,5), (2,6), (2,7), (2,8), (2,9), (3,0), (3,1), (3,2), (3,3), (3,4), (3,5), (3,6), (3,7), (3,8), (3,9), (4,0), (4,1), (4,2), (4,3), (4,4), (4,5), (4,6), (4,7), (4,8), (4,9), (5,0), (5,1), (5,2), (5,3), (5,4), (5,5), (5,6), (5,7), (5,8), (5,9), (6,0), (6,1), (6,2), (6,3), (6,4), (6,5), (6,6), (6,7), (6,8), (6,9), (7,0), (7,1), (7,2), (7,3), (7,4), (7,5), (7,6), (7,7), (7,8), (7,9), (8,0), (8,1), (8,2), (8,3), (8,4), (8,5), (8,6), (8,7), (8,8), (8,9), (9,0), (9,1), (9,2), (9,3), (9,4), (9,5), (9,6), (9,7), (9,8), (9,9). The blue squares are at (1,2), (1,3), (1,4), (1,5), (1,6), (1,7), (1,8), (1,9), (2,0), (2,1), (2,2), (2,3), (2,4), (2,5), (2,6), (2,7), (2,8), (2,9), (3,0), (3,1), (3,2), (3,3), (3,4), (3,5), (3,6), (3,7), (3,8), (3,9), (4,0), (4,1), (4,2), (4,3), (4,4), (4,5), (4,6), (4,7), (4,8), (4,9), (5,0), (5,1), (5,2), (5,3), (5,4), (5,5), (5,6), (5,7), (5,8), (5,9), (6,0), (6,1), (6,2), (6,3), (6,4), (6,5), (6,6), (6,7), (6,8), (6,9), (7,0), (7,1), (7,2), (7,3), (7,4), (7,5), (7,6), (7,7), (7,8), (7,9), (8,0), (8,1), (8,2), (8,3), (8,4), (8,5), (8,6), (8,7), (8,8), (8,9), (9,0), (9,1), (9,2), (9,3), (9,4), (9,5), (9,6), (9,7), (9,8), (9,9). The path is defined by black and blue lines. The black lines are at (0,0), (0,1), (0,2), (0,3), (0,4), (0,5), (0,6), (0,7), (0,8), (0,9), (1,0), (1,1), (1,2), (1,3), (1,4), (1,5), (1,6), (1,7), (1,8), (1,9), (2,0), (2,1), (2,2), (2,3), (2,4), (2,5), (2,6), (2,7), (2,8), (2,9), (3,0), (3,1), (3,2), (3,3), (3,4), (3,5), (3,6), (3,7), (3,8), (3,9), (4,0), (4,1), (4,2), (4,3), (4,4), (4,5), (4,6), (4,7), (4,8), (4,9), (5,0), (5,1), (5,2), (5,3), (5,4), (5,5), (5,6), (5,7), (5,8), (5,9), (6,0), (6,1), (6,2), (6,3), (6,4), (6,5), (6,6), (6,7), (6,8), (6,9), (7,0), (7,1), (7,2), (7,3), (7,4), (7,5), (7,6), (7,7), (7,8), (7,9), (8,0), (8,1), (8,2), (8,3), (8,4), (8,5), (8,6), (8,7), (8,8), (8,9), (9,0), (9,1), (9,2), (9,3), (9,4), (9,5), (9,6), (9,7), (9,8), (9,9). The blue lines are at (1,2), (1,3), (1,4), (1,5), (1,6), (1,7), (1,8), (1,9), (2,0), (2,1), (2,2), (2,3), (2,4), (2,5), (2,6), (2,7), (2,8), (2,9), (3,0), (3,1), (3,2), (3,3), (3,4), (3,5), (3,6), (3,7), (3,8), (3,9), (4,0), (4,1), (4,2), (4,3), (4,4), (4,5), (4,6), (4,7), (4,8), (4,9), (5,0), (5,1), (5,2), (5,3), (5,4), (5,5), (5,6), (5,7), (5,8), (5,9), (6,0), (6,1), (6,2), (6,3), (6,4), (6,5), (6,6), (6,7), (6,8), (6,9), (7,0), (7,1), (7,2), (7,3), (7,4), (7,5), (7,6), (7,7), (7,8), (7,9), (8,0), (8,1), (8,2), (8,3), (8,4), (8,5), (8,6), (8,7), (8,8), (8,9), (9,0), (9,1), (9,2), (9,3), (9,4), (9,5), (9,6), (9,7), (9,8), (9,9).

Now let's run the program further up to number 13 992:

So we need to check if an enclosed has been created on that side, but counting the area is unnecessary. Nevertheless, we can represent the rule this way, setting the circle direction to right:

You may ask, why that field is "taken", not "taken or border". From what I found through some examples, if that field is border, the enclosed area on the right is impair, so the line cannot step in the other direction anyway. But it needs further examination.

The next error, at 14 004 has something to with how I defined the universal rules of approaching an older section of the line, it needs to be reworked in light of the C-shape the main line can create with the border.

We need to take a few steps back, and then we can create the rule. It is similar to the universal 2-distance rule on the side, it just checks the field 2 behind and 1 to the side too. Even though the area counted is pair, now stepping to the right is disabled.

At 55 298, we get this:

Let's analyze it! A double C-shape is created, because the line occupied the A field, and out of the B, C and D fields it exited the right-side area at C. It means, the area enclosed by the marked fields is pair. In this case, we shouldn't step right and the rule will therefore look like:

But what if from the A position, we step upwards in another situation? Compare these two on 11 x 11:

If the area we started with is pair, then the other will be impair. We can only enter the area at the light-gray field and will exit at A. From there we must go through B, C and D, and then a double C-shape is again created.

One certain situation reveals the incorrectness of the 7-rules when it comes to a 9-grid. In the following example, when I apply a rule rotated, it will disable a field that would otherwise be viable.

Rotating was not necessary to start with on 7 x 7, because no such situation occurred.

We can see that defining a rule with future line starts and ends does not tell us on which side the future line was created. That is the side that contains the enclosed area. We need to therefore replace such rules with area counting, which we actually already did, with the exception of Future L. Here the future line couldn't have been created on the other side, because that's the side the live end is at right now. And area counting is not always possible, like in this situation:

As we run the program further, we will discover this at 227 200:

Intuitively, we can draw up the square, and let's mark the exit as well. There can be loops on the upper, lower and right side, they have no importance when tracing it back to the live end. There is only one way to go through.

233 810 will look like:

Once we step to A, it is unavoidable to get to B before entering the outlined area. It is because we can only reach B from the left or the bottom. The area is impair, therefore we cannot complete it starting in C and ending in D.

If we omit the C field from the area, the area becomes pair. It is clear that the start and end field being across each other, a pair amount of fields cannot be filled. We must therefore enter the area now.

234 256 has at first sight something to do with future lines.

But it is more than that. Notice that enclosed areas has been created on both sides simultaneously. Because of the universal rules for approaching an older section of the line, now we have no option to move. The areas can be filled individually, but we cannot step to left and right at the same time. We have to create 2-distance rules, which take both sides into account.

These are just a few of the possible combinations.

Any of the far straight rules (straight, mid across and across as I call them, depending on the horizontal distance of the obstacle) on the left side can be combined with any of those on the right side when the enclosed area is going to the same direction - left for left side and right for right side. And the same is true when the pattern is rotated to the left or right side. As far as programming concerned, it just needed a rework of the universal rules, we didn't need to make completely new ones.

[illegible]

We have made a similar rule previously. Now we need to simplify it.

626 071 is:

With the marked area being pair, if we enter the area by stepping left, we will exit at A. But we can only get there from B; if we entered from the top, nothing would fill B, and we cannot enter and exit it after we left the area - subtracting 1 from the area would make it impair, so then we couldn't have exited at A. The taken field C creates a C-shape, which we need to step into from B. The universal far across rule have to be extended. By default, we disable the option to step straight or right if the counted area is impair. When it is pair, we need to disable the left field.

The same concept we encounter at 635 301, only the C-shape is created when we enter an area, on the other side of it.

We have seen this in the third 9 x 9 rule. There the taken field next to the exit was in middle across position, and now it is across. And we also need to think about an obstacle straight ahead. Here are the original universal rules and their modifications.

Straight, circle direction left:

Circle direction right:

Side, with taken fields above and below:

I have made some changes by adding some empty fields in side positions, so they are the same as the straight rules, just rotated.

Also, I have added the side across down rule and changed the straight across rule accordingly. Not only fields next to each other can define an area, they can be across too. In that case, if the area originally was marked impair, now it has to be pair.

Notice that in side rules, when the taken field that would create the C-shape is below the obstacle creating the area, it can be a border field too. We have seen an example of that previously.

The diagram shows a grid with a red-shaded region. Inside this region is a green-shaded square, which represents a 'hole'. A black line traces the outer boundary of the red region, and a blue line traces the inner boundary of the green hole. Labels A, B, C, D, and E are placed at various points on these boundaries to illustrate the concept of a hole in a region.

In order to make a walkthroughable area, you would need to extend it by pairs of fields next to each other, like D and E. One will be filled at a pair amount of steps, the other at an impair amount.

This is the rule representation. The reddish arealine now means the arealine is impair, and we know that the entry and exit points are the arealine start and end fields.

A 10x10 grid with a black path and colored regions. The path starts at (0,0), goes right to (1,0), down to (1,9), right to (2,9), up to (2,8), right to (3,8), down to (3,7), right to (4,7), up to (4,6), right to (5,6), down to (5,5), right to (6,5), up to (6,4), right to (7,4), down to (7,3), right to (8,3), up to (8,2), right to (9,2), down to (9,1), right to (10,1), up to (10,0). The regions are: red (0,0)-(10,10), blue (0,0)-(1,1), blue (1,1)-(2,2), blue (2,2)-(3,3), blue (3,3)-(4,4), blue (4,4)-(5,5), blue (5,5)-(6,6), blue (6,6)-(7,7), blue (7,7)-(8,8), blue (8,8)-(9,9), blue (9,9)-(10,10).

The figure consists of two side-by-side 10x10 grids. Both grids have a black boundary that is 1 cell thick. The interior of the grid is divided into a blue region and a grey region. The blue region is located in the upper-left quadrant, and the grey region is located in the lower-right quadrant. The two regions are separated by a white region. In the right diagram, four cells are labeled: 'A' is a white cell at (row, col) = (4, 5), 'B' is a white cell at (4, 6), 'C' is a grey cell at (5, 4), and 'D' is a grey cell at (5, 5). The labels are in black font.

To mark the two areas, each one has to be given a directional obstacle next to the count area end field. In this case, it represents a taken field, but we don't go wrong if we include the border as well.

So we get the 2-distance across rule, the straight 3-distance rule to prevent a double C-shape, and the square constellation with 3 areas. All of them are rotated clockwise or counter-clockwise.

33 34

The field previously marked with B is now empty. But we still need to step in that direction, due to the area enclosed by A, which obstacle could as well be in B.  
The rule will be now symmetrical. It is similar to the square obstacle pattern.

The same concept we encounter at 725 325. We have seen this previously, just with C-shape, not an area.

The rule will now look like this:

740 039 is a slight modification.

The only difference is, that the obstacle is 3-distance away. With the area being impair, if we enter at A, we must exit at C.

What if we omit D from the area? Then the area will be pair, so we must exit at B, and the only way to get there is from C. And if D is included, we can only step to C from there. Either way, we step away from the area beyond D, so the rule will be:

811 808:

Recognize it is a variation of the square obstacle pattern where instead of an area, there is a C-shape at the rule's upper edge.

1 261 580:

Again, same pattern with area. The upper obstacle is now moved, but it will satisfy the previous examples too. The rule replaces the old one.

2 022 337 is getting stuck because of the stair-shaped walls that force the future line along them. Therefore, an area is created with only one field to go in and out of it. What is the solution?

Though not as universal as we want it to be, this will solve this specific situation:

And soon, at 2 022 773 we encounter a similar one:

			+		
		+			
←					
↖					
↗	×	↗	↖	↘	
	—				

On 17 x 17, we can construct a situation where the obstacle across the stair is 2 behind and 2 to right. As the table size increases, the stair-obstacle narrowing can move infinite distance away from the live end. That's why it is important to group these rules as one.

	←		
	↗		
	→	×	
		↓	×

The figure consists of two side-by-side square grids, each representing a maze. The grids are composed of small squares. In both grids, the top half is red, and the bottom half is white. A black path is drawn in the red area of both grids, starting from the top left and ending at the bottom right. In the right grid, a blue path is also drawn, starting from the top left and ending at the bottom right, following a different route than the black path. The blue path is composed of several segments, some of which are highlighted in blue.

41      42

From our experience, the area can be substituted with C-shape.

3 225 432 is a variation of the impair area imbalance rules we have seen before.

8 076 012 builds upon the existing rule where C-shapes are created on both sides if we enter an impair area.

Here, a C-shape at the start would force the line to enter the area.

Soon we get a similar situation, only here it is the imbalance of pair and impair fields that is to blame.

If we step to A, we cannot step left and therefore must continue to B (or right). From B, the only possibility is C, but the 5 x 3 area is not just impair, there is less of the C-parity field than the other. In the rule, I introduced a new field that indicates the entry point; this has always been the start field until now.

At 19 717 655 the program stops.

Obviously, we cannot step straight, but had we extended the future line until the end corner, the situation would not have occurred and we would have just got this:

Though the algorithm including the reliance on the future lines is just as solvable, we miss patterns and therefore narrow the spectrum of the discoverable rules. We would eventually discover the patterns as we increase the table, but why not gain the most out of the 9 x 9 study? From now on, future lines are treated as a visible aid, but they do not play a role in deciding which fields are available for the next move. When a possible field is within the body of a future line, the program should stop.

←	→		→	↑	
→					
→				×	
←	→		→	↓	×

In the following section I list the 9 x 9 rules in chronological order. The patterns are not introduced when they are first recognized, but when they are first needed, meaning that they disable fields that the other rules don't. And the disabled fields have to be empty.

Still, the number of completed walkthroughs before the appearance of the rule may not be the same as the number of those before getting stuck in the lack of that rule. If the rule disables a field right to a possible field, the left branch would run through first.

A 10x10 grid with a red-shaded region. The red region is defined by the following cells (row, column): (1,1), (1,2), (1,3), (1,4), (1,5), (1,6), (1,7), (1,8), (1,9), (1,10), (2,1), (2,2), (2,3), (2,4), (2,5), (2,6), (2,7), (2,8), (2,9), (2,10), (3,1), (3,2), (3,3), (3,4), (3,5), (3,6), (3,7), (3,8), (3,9), (3,10), (4,1), (4,2), (4,3), (4,4), (4,5), (4,6), (4,7), (4,8), (4,9), (4,10), (5,1), (5,2), (5,3), (5,4), (5,5), (5,6), (5,7), (5,8), (5,9), (5,10), (6,1), (6,2), (6,3), (6,4), (6,5), (6,6), (6,7), (6,8), (6,9), (6,10), (7,1), (7,2), (7,3), (7,4), (7,5), (7,6), (7,7), (7,8), (7,9), (7,10), (8,1), (8,2), (8,3), (8,4), (8,5), (8,6), (8,7), (8,8), (8,9), (8,10), (9,1), (9,2), (9,3), (9,4), (9,5), (9,6), (9,7), (9,8), (9,9), (9,10), (10,1), (10,2), (10,3), (10,4), (10,5), (10,6), (10,7), (10,8), (10,9), (10,10). A green-shaded region is located within the red region, covering cells (3,2), (3,3), (3,4), (3,5), (3,6), (3,7), (3,8), (3,9), (3,10), (4,2), (4,3), (4,4), (4,5), (4,6), (4,7), (4,8), (4,9), (4,10), (5,2), (5,3), (5,4), (5,5), (5,6), (5,7), (5,8), (5,9), (5,10), (6,2), (6,3), (6,4), (6,5), (6,6), (6,7), (6,8), (6,9), (6,10), (7,2), (7,3), (7,4), (7,5), (7,6), (7,7), (7,8), (7,9), (7,10), (8,2), (8,3), (8,4), (8,5), (8,6), (8,7), (8,8), (8,9), (8,10), (9,2), (9,3), (9,4), (9,5), (9,6), (9,7), (9,8), (9,9), (9,10), (10,2), (10,3), (10,4), (10,5), (10,6), (10,7), (10,8), (10,9), (10,10). A black outline of a complex shape is overlaid on the grid, with a small green rectangle inside it.

A diagram of a 10x10 grid. A black line forms a boundary that starts at the top-left corner, goes right to the top edge, then down to the 4th row, left to the 2nd column, and then follows a complex path with several loops and indentations, ending at the bottom-left corner. A green rectangle is drawn on the grid, spanning from the 2nd column to the 4th column and from the 4th row to the 6th row. The grid cells are colored: red for cells outside the black boundary, light blue for cells inside the boundary but outside the green rectangle, and grey for cells inside the green rectangle.

740 363, Triple Area

2 023 198, Double Area Stair 2

2 022 763, Double Area Stair

2 034 435, Mid Mid Across 3 Determined (and Mid Across 3 Impair Determined)

2 059 934, Mid Across 3 Impair Determined

8 076 706, Double C-Shape Start C

8 076 202, Straight Mid Across 3 End C

8 076 762, Double C-Shape Determined

If we step left in the impair area, we can only exit at the count area middle field, but there is one less field of that type than the other.

And no fields can be omitted from the area for entry and exit later.

When the count area start field + middle field is omitted (subtracting a pair amount of cells from the area), the possible exit is the count area end field, which has a different parity than the field to the left.

When the count area middle + end field is omitted, the possible exit is the count area start field, which has again different parity.

By now, we are able to group some rules and even solve the original 21 x 21 example. Previously, we have covered all of the cases where an obstacle is 2 distance away from the live end. Let's examine distances of 3, 4 and so on in this constellation:

Besides the count area fields being empty, here I also assume that the left field and the field below the obstacle is also empty. In the future, this might have to be changed and new constellations added.

Knowing the difference between the number of pair and impair fields, we can make a decision in some cases.

Let's start with this:

The distance is 3, the area is pair, and the number of pair and impair fields are the same. We can either enter the area now (stepping left) or later (up or right). Either way, we can start and end the area on a different color, so nothing should be disabled.

Here, the area is still pair, but there are 12 black fields and 10 white. To fill it, two lines of an impair length would be needed, each starting and finishing on a black field. Now, it is possible to enter and exit the black field in the upper left corner of the area, but we cannot do it with the field 2 below. And there are no more black fields on the boundary of the area. Filling it is therefore impossible.

When there are one more black field than white (8 and 7 in this case), the area is impair. If we enter now, we can exit at the count area end (to make a line of pair length), and the corner black can be filled later. We can also enter at the corner black later to exit at the count area end.

Here, there are one more white field than black. To fill the area, 1 line of impair length would be needed that starts and ends on white, but if the enter the area now, the corner black could not have been filled. Now there are 2 less black fields available for the rest of the area, but making two lines starting and ending on white is impossible, there are not that many white fields on the boundary. Needless to say that we cannot enter later either, there is only one white field on the boundary.

If there are even fewer black fields relative to the white, the situation is the same.

At 4 distance (and in any case), we still don't have a problem filling an area that has equal number of black and white fields.

When the number of black fields are two more than the whites (16 and 14):

Two black to black lines would be needed to fill the area. Apart from the black in the corner, there is only one black field on the boundary.

If black = white + 1:

If we enter now by stepping left, there will have to be one more line even if we exit on black. That line has to go from black to black, so it can only be the corner field. Have we exited at the other black field (the third on the boundary), either the second or the fourth could not have been filled.

**This direction therefore has to be disabled.**

We can enter later without problems to start at the corner field, then the second, go inside the area and end at the third.

If  $\text{black} = \text{white} - 1$ :

A line that starts and ends on white can be drawn, no matter if we enter now or later. If we enter now, the next field has to be the corner black, and then there will be a line between the two white fields on the boundary.

If  $\text{black} = \text{white} - 2$ :

Two white to white lines would be needed, but there are only 3 white fields on the boundary, and none is the corner.

Without finding concrete examples, at 5 distance I only draw the boundary and go through the different possibilities.

**black = white + 2**

If we enter now and finish at black, only two black fields remain. Drawing two black to black lines is not possible, so this direction has to be disabled. We can enter later, go through the corner and draw another black to black line.

## 2) Pair distance, impair black and white: 6, 10 etc.

If we enter now and exit at black,  $(B-1) / 2$  black to black lines can be drawn.

If we exit at white,  $(W+1) / 2$  white to white lines can be drawn. (We have to move to the corner black and exit at the first white during the first line)

If we enter later,  $(B+1) / 2$  and  $(W-1) / 2$  black and white lines are possible, respectively.

The rule is double:

- If the number of black fields is greater or equal than the number of whites plus  $(B+1) / 2$ , we cannot enter now.
- If the number of white fields is greater or equal than the number of blacks plus  $(W+1) / 2$ , we have to enter now.

## 3) Impair distance, impair black and pair white: 5, 9 etc.

If we enter now and exit at black,  $(B-1) / 2$  black lines are possible.

If we exit at white,  $W/2$  white lines are possible.

If we enter later, the number of black lines can be up to  $(B+1)/2$ , the whites  $W/2$

Single rule: When the difference is at least  $(B+1)/2$ , we cannot enter now.

## 4) Impair distance, pair black and impair white: 3, 7 etc.

If we enter now and exit at black,  $B / 2$  black lines are possible.

If we exit at white: Similarly to the first of the four cases, a black to black edge will remain on one side. Drawing  $(W-1) / 2$  more white lines is either not possible, or if we do so, the corner black may make up a black to black line, decreasing the difference.

When entering later,  $B / 2$  and  $(W-1) / 2$  are the numbers. Since they match the above, no rule is applied.

Check the original 21 x 21 example. Two steps back, there will be 9 distance with the wall to the left. The number of black fields on the edge is 5, therefore there cannot be 3 more black fields in the area than white, but counting them, they are 51 and 48.

Does this procedure apply to any of the size-specific rules? Not exactly, but let's look them through. Here are all of them that deal with black and white field imbalance:

As a reminder, they indicate impair areas, and in the first two case if the count area start field (black) type is not 1 field more in the area, we cannot enter later. In the fourth, the field marked with + (white) is the type that needs to be 1 more than black, otherwise stepping forward is forbidden.

I will take the second rule under examination as it contains both a horizontal and vertical offset.

If we enter now:

- We can exit at the end white, so 1 white line is possible.
  - We can exit at the black farthest away and then make a line using the black field closest. 1 black line is possible.
- I will mark it like this: 1W -> 1B

If we enter later:

- Having two black fields, 1 black line is possible.
  - There is only one white field. It sits in a corner, but the two black fields will give 1 black line. 0 white line is possible.
- 0W -> 1B

So if there are 1 more white fields in the area than black (1W), we cannot enter later.

Now let's increase the vertical distance.

If we enter now, 1 white line to 2 black lines are possible. There are 2 black fields on a corner.

1W -> 2B

Later, 0 white line and 2 black lines can be drawn.

0W -> 2B

Conclusion: in case of 1W, we cannot enter later.

5 distance:

Now: 2W -> 1B

Later: 1W -> 2B

2W: cannot enter later

2B: cannot enter now

7 distance:

3 distance:

75      76

4 distance:

Now: 2W -> 0B

If we exited at the nearest white after entering, we have either not entered the area or not filled the black field.

Later: 2W -> 0B

5 distance:

Now: 0W -> 3B

If we reserved the 3 black corners, the only way to end the first line on black is to move downwards after entry.

Later: 0W -> 3B

6 distance:

Now: 3W -> 1B

Similarly, we need to move down after entry in order to finish at the second black field, leaving the first for itself.

Later: 3W -> 1B

7 distance:

Now: 1W -> 3B

Later: 0W -> 4B

There cannot be one white line, because out of the first three black fields only 2 would be filled.

Notice that as we added 4 distance to 3, now both the white and the black end of the ranges have increased by one.

But we are not finished, we still need to examine the distance of 8.

Now: 4W -> 1B

After entry, we need to move up to fill the corner black and exit at the first white field.

At 4 distance, only 2W was possible, but now we can exit at the first white and fill the area when entering at the second and exiting at the third.

Later: 3W -> 1B

After this practice, let's calculate how many white and black lines we can draw when we have an obstacle x and y distance away.

There are three cases to look at.

1. Equal horizontal and vertical distance

There are an x number of black fields on the area boundary.

x = 1:

Now: 0W -> 0B

We cannot enter later.

x = 2:

Now: 0W -> 1B

Later: 1B

x = 3:

Now: 0W -> 2B

Later: 1B -> 2B

x = 4:

Now: 0W -> 3B

Later: 1B -> 3B

x = n:

Now: 0W -> (n-1)B

Later: 1B -> (n-1)B

There is an x amount of corner blacks, but we need to enter the area as well.

Conclusion: if the white and black fields in the area are equal, we cannot enter later.

## 2. Larger horizontal distance

If the added distance is pair:

$2n = 2$ :

Now: Can we make 1W? No, because that would require going through the first black field to end at the first white, while filling the other parts of the area too. What about the black line count? Without the horizontal addition,  $(x-1)B$  was possible. Can we now make  $x$  amount? Yes, by stepping down and ending the line at the first white field and the second black, having filled everything except the corner blacks.

$0W \rightarrow xB$

Later: We can use all corner blacks, and the line starting at the first white and ending at the second black will fill the area.

$0W \rightarrow xB$

$2n = 4$ :

Now: 1W is now possible by ending at the second white, and everything can be filled on the way, while  $(x+1)B$  is not possible. Two inline blacks remain after taking off all the corner blacks, and we have to use one of them to exit the first line.

$1W \rightarrow xB$

Later:  $1W \rightarrow (x+1)B$

The line connecting the two inline blacks can fill the rest of the area.

$2n = 6$ :

Now: If the first line goes through the first black and exits at the first white, the second line can go between the remaining two whites.

As far as the blacks concerned, if we exit at the second black, we can use the third and fourth for a line, plus the  $x$  amount of corners.

$2W \rightarrow (x+1)B$

Later: Because of three inline white fields, one white line is possible. For blacks, we can use all the corners and two out of the three inline blacks.

$$1W \rightarrow (x+1)B$$

We don't need more examples.

For  $2n$  added fields, there will be  $n$  amount of inline white fields.

If we enter now,  $(n+1 - (n+1) \% 2) / 2$  white lines can be drawn if  $n > 1$ .

The black line count is all the corners minus one for finishing the first line, plus one for each remaining pair.

$$x + (n-1 - (n-1) \% 2) / 2$$

For entering later, the white line count is  $(n - n \% 2) / 2$ , and the black line count is  $x + (n - n \% 2) / 2$ .

**If the added distance is impair:**

$$2n + 1 = 1, n = 0:$$

Now: If we end the first line at the first white, we could not have filled the corner black and the area simultaneously.  $xW$  is therefore not possible, but  $(x-1)W$  is.

And since there is only one black field, the black line count will be 0.

$$(x-1)W \rightarrow 0B$$

Later: All the corner whites plus the neutral line makes  $(x-1)W$ . The black line count is still 0. The black field is a corner, but it will be counterbalanced by at least one white to white line.

$$(x-1)W \rightarrow 0B$$

$$2n + 1 = 3, n = 1:$$

Now: Aside the corner whites,  $1W$  is possible by ending at the second white, just like in the  $2n = 4$  case.

The black line count is now 1, but we need to step downwards and finish at the first white and second black in order to have the corner black available.

$$xW \rightarrow 1B$$

$$\text{Later: } xW \rightarrow 1B$$

$$2n + 1 = 5, n = 2:$$

Now: We can step up and finish at the first white, because line connecting the remaining two whites can fill the area.

$$(x+1)W \rightarrow 1B$$

Later:  $xW \rightarrow 2B$

From now on, the calculations are the following:

If we enter now,  $x + (n - n \% 2) / 2$  white lines can be drawn if  $n > 0$ .

The number of black fields is  $n+1$ , and when we use up one to finish the first line,  $n$  amount remains, one of which is a corner. Add one to make pairs, and the formula will be  $(n+1 - (n+1) \% 2) / 2$ .

When entering later, the white line count is  $x-1 + (n+1 - (n+1) \% 2) / 2$ , and the black line count is  $(n+2 - (n+2) \% 2) / 2$  if  $n > 0$ .

### 3. Larger vertical distance

### If the added distance is pair:

$2n = 2$ :

Now: It is possible to exit at the white field, having filled everything. The previous step must have been the last black.

When counting the blacks, we exit the first line at the first black field above the stair, and  $x$  amount of corner blacks will remain.

$1W \rightarrow xB$

Later: Same as the  $2n = 2$  case previously.

$0W \rightarrow xB$

$2n = 4$ :

Now: There cannot be more than 1W. And the black line count is unchanged too. One of the two inline blacks will be used for completing the first line, and one remains plus x amount of corner.

$1W \rightarrow xB$

Later:  $1W \rightarrow (x+1)B$

$2n = 6$ :

Now:  $2W \rightarrow (x+1)B$

Later:  $1W \rightarrow (x+1)B$

When entering now, the general formula will be  $(n+1 - (n+1) \% 2) / 2$  white and  $x + (n-1 - (n-1) \% 2) / 2$  black.

The later case is the same as previously,  $(n - n \% 2) / 2$  for white and  $x + (n - n \% 2) / 2$  for black.

### If the added distance is impair:

$$2n + 1 = 1, n = 0:$$

Now: 1W -> (x-1)B

Later: (see horizontal case) 0W -> (x-1)B

$$2n + 1 = 3, n = 1:$$

Now: 2W -> (x-1)B

Later: 1W -> xB

Now: The corner white always gives 1. Then make pairs with the remaining inline whites plus the white field we are stepping first.

$$1 + (n+1 - (n+1) \% 2) / 2$$

For the blacks, one of the inline black fields will be taken by the first line. We can then make pairs with the remaining inline blacks and add the corners.

$$x - 1 + (n - n \% 2) / 2.$$

Later: The white line count is  $1 + (n - n \% 2) / 2$  if  $n > 0$ , and the black line count is  $x - 1 + (n+1 - (n+1) \% 2) / 2$ .

Next, we will look at the corner discovery algorithm.

Starting with 1 horizontal and 2 vertical distance, we check if that field is taken.

If so, we mirror sides and start the algorithm on the right side.

If not, we increase the horizontal distance by one until we find a taken field or run into the border.

If it is a border field, we increase the vertical distance and start with 1 horizontal distance again.

Otherwise, we check if the bottom field is free, and by comparing the index of the corner field with the field above, we can determine if the line is going down and left, so the enclosed area is on the side we want.

A diagram illustrating a 2D grid with a central region of gray squares, an orange boundary, and a black boundary. The grid is composed of light gray squares. A central region is defined by a thick orange boundary, which is irregular and jagged. Inside this orange boundary, there are several small gray squares. A black line, representing a boundary, follows the outer edge of the orange boundary, also showing some irregularities. The area between the black boundary and the orange boundary is shaded in a light pink color. The overall shape is roughly rectangular but with complex, non-linear edges.

With the border on top, now we have no option to move.

The following rules are active, in addition to the universal one that disables the left field:

There are three more black fields in the area than white, so there is not enough vertical distance for entering and exiting that many times.

The straight-to-side algorithm has to be rotated upwards, so we get this:

Let's look at the distances from 3 to 6 to have an example of each case of modulo 4.

$D \pmod{4} = 3$ :

Now:  $1W \rightarrow 0B$ ,  $2W \rightarrow 1B$  etc. =  $(D+1)/4$   $W \rightarrow (D-3)/4$   $B$

Later:  $0W \rightarrow 1B$ ,  $1W \rightarrow 2B$  etc. =  $(D-3)/4$   $W \rightarrow (D+1)/4$   $B$   
(double rule)

$D \pmod{4} = 0$ :

Now:  $1W \rightarrow 0B$ ,  $2W \rightarrow 1B$  etc. =  $D/4$   $W \rightarrow D/4 - 1$   $B$

Later:  $1W \rightarrow 1B$ ,  $2W \rightarrow 2B$  etc. =  $D/4$   $W \rightarrow D/4$   $B$   
(single rule)

$D \pmod{4} = 1$ :

Now:  $1W \rightarrow 1B$ ,  $2W \rightarrow 2B$  etc. =  $(D-1)/4$   $W \rightarrow (D-1)/4$   $B$

Later:  $1W \rightarrow 1B$ ,  $2W \rightarrow 2B$  etc. =  $(D-1)/4$   $W \rightarrow (D-1)/4$   $B$   
(no rule)

$D \pmod{4} = 2$ :

Now:  $2W \rightarrow 1B$ ,  $3W \rightarrow 2B$  etc. =  $(D+2)/4$   $W \rightarrow (D-2)/4$   $B$

Later:  $1W \rightarrow 1B$ ,  $2W \rightarrow 2B$  etc. =  $(D-2)/4$   $W \rightarrow (D-2)/4$   $B$   
(single rule)

And as we step back, we find the point where the line should move in another direction.

If we continue the line from here, keeping left, we will run into this situation:

Double C-Shape Determined:

The number of black fields is one more than the white. Without the size-specific rule, we could step straight. Let me remind you that this rule is based upon the Double C-Shape. If we stepped straight and then into the area, we would come out in the middle, creating two C-shapes.

What this actually means is that there would be two fields of the same color that cannot be filled simultaneously.

If we now extended the area to include the 4 fields straight ahead, there would be still one more black than white, and by stepping straight, to a white field, it is clear that a black to black line cannot be drawn.

An extension of the universal rule is necessary to include cases of a "big" area where the obstacle is on the other side of the live end.

$D \% 4 = 3$ :

Now:  $1W \rightarrow 0B = (D+1)/4$   $W \rightarrow (D-3)/4$   $B$

Later:  $1W \rightarrow 0B = (D+1)/4$   $W \rightarrow (D-3)/4$   $B$   
(no rule)

$D \% 4 = 0$ :

Now:  $1W \rightarrow 0B = D/4$   $W \rightarrow D/4 - 1$   $B$

Later:  $1W \rightarrow 1B = D/4$   $W \rightarrow D/4$   $B$   
(single rule)

$D \% 4 = 1$ :

Now:  $2W \rightarrow 0B = (D+3)/4$   $W \rightarrow (D-5)/4$   $B$

Later:  $1W \rightarrow 1B = (D-1)/4$   $W \rightarrow (D-1)/4$   $B$   
(double rule)

$D \% 4 = 2$ :

Now:  $2W \rightarrow 1B = (D+2)/4$   $W \rightarrow (D-2)/4$   $B$

Later:  $1W \rightarrow 1B = (D-2)/4$   $W \rightarrow (D-2)/4$   $B$   
(single rule)

While this will not solve the case above (we are not able to step left), we can construct one where it is of use when the Double C-Shape Determined rule is turned off.

We can now continue working out all scenarios.

So far we have solved all cases indicated by green:

- 0 vertical distance small area
- x horizontal and y vertical distance small area
- 0 horizontal distance small area
- 0 horizontal distance big area

I will now take the case of x horizontal and y vertical distance big area. All representations are the same as in the small area case, only the area is on the other side.

So I will just summarize the black and white limits here.

### 1. Equal horizontal and vertical distance

x = 2:

Now: 0W -> 1B

Later: 1B

x = 3:

Now: 0W -> 2B

Later: 1B -> 2B

x = n:

Now: 0W -> (n-1)B

Later: 1B -> (n-1)B

Exactly the same as with the small area.

### 2. Larger horizontal distance

#### If the added distance is pair:

2n = 2:

Now: 1W is possible. The entry field and the first white is at least 2 distance from each other, the whole area can be filled between them.

1W -> xB

Later: All corner blacks can be used. The line between the first black and first white will fill the area.

0W -> xB

General:

The only difference is the  $n = 1$  case. Otherwise, the number of inline and corner fields are the same.

Now:  $(n+1 - (n+1) \% 2) / 2 W \rightarrow x + (n-1 - (n-1) \% 2) / 2 B$

Later:  $(n - n \% 2) / 2 W \rightarrow x + (n - n \% 2) / 2 B$

**If the added distance is impair:**

$2n + 1 = 1, n = 0:$

Now:  $xW$  is possible.

$xW \rightarrow 0B$

Later: Same values as previously.

$(x-1)W \rightarrow 0B$

$2n + 1 = 3, n = 1:$

Note that in the small area case, there were  $x-1$  corner whites and 1 corner black. Now there are  $x$  amount of corner whites and 2 inline blacks instead of 1.

Now:  $xW \rightarrow 0B$

Later:  $xW \rightarrow 1B$

$2n + 1 = 5, n = 2:$

Now:  $(x+1)W \rightarrow 1B$

Later:  $(x+1)W \rightarrow 1B$

General:

Now:  $x + (n+1 - (n+1) \% 2) / 2 W \rightarrow (n - n \% 2) / 2 B$

Later:  $x + (n - n \% 2) / 2 W$  if  $n > 0 \rightarrow (n+1 - (n+1) \% 2) / 2 B$

3. Larger vertical distance

**If the added distance is pair:**

We will find it is the same as the small area.

$2n = 2:$

Now:  $1W \rightarrow xB$

Later:  $0W \rightarrow xB$

$2n = 4:$

Now:  $1W \rightarrow xB$

Later:  $1W \rightarrow (x+1)B$

General:

Now:  $(n+1 - (n+1) \% 2) / 2 W \rightarrow x + (n-1 - (n-1) \% 2) / 2 B$

Later:  $(n - n \% 2) / 2 W \rightarrow x + (n - n \% 2) / 2 B$

**If the added distance is impair:**

$2n + 1 = 1, n = 0:$

Now:  $1W \rightarrow (x-1)B$

Later:  $0W \rightarrow (x-1)B$

$2n + 1 = 3, n = 1:$

Here comes the change again, due to having one more corner black field and one less corner white field than in the small area case.

Now:  $1W \rightarrow xB$

Later:  $1W \rightarrow xB$

General:

Now: If  $n > 0$ , we can use all corner blacks after exiting the first line.

$(n+2 - (n+2) \% 2) / 2 W \rightarrow x + (n-1 - (n-1) \% 2) / 2 B$  if  $n > 0$ .

Later:  $(n+1 - (n+1) \% 2) / 2 W \rightarrow x + (n - n \% 2) / 2 B$  if  $n > 0$ .

While creating a case to verify the newly created rule set, I have encountered this:

It is not possible to continue after stepping upwards.

But where is the missing part?

On the left, the largest area contains 1 more white field than black, and on the right it is 2 more black. It would be possible if the upper left corner was filled, like this:

So it is not any of the small area rules and neither the 0 horizontal distance big area rule that has something to do with it.

One thing is sure, we have been using the small area representations when defining the rule set, which does not give us the minimal area in this case.

See the difference:

Can it be a problem?

We will see, but let's look at one detail: If we step upwards, we have to step left to fill the corner white, otherwise it is only good for an exit, which we do not want if the area contains 1 more white fields than black (for the left representation).

After this, we step upwards and then left again. We did not enter the area.

The 1 added distance case is therefore  $0W \rightarrow (x-1)B$  when entering now by stepping upwards and  $1W \rightarrow (x-1)B$  when stepping right.

To simplify things, I will specify the cases again using the minimal area representation.

Notice that these are the same as the small area patterns, things are just mirrored, so that the previous horizontal expansion is now vertical.

n = 1

Now:  $(n+1 - (n+1) \% 2) / 2$  W  $\rightarrow x + (n-1 - (n-1) \% 2) / 2$  B

Later:  $(n - n \% 2) / 2$  W  $\rightarrow x + (n - n \% 2) / 2$  B

n = 0

Now:  $1 + (n+1 - (n+1) \% 2) / 2$  W  $\rightarrow x - 1 + (n - n \% 2) / 2$  B

Later:  $1 + (n - n \% 2) / 2$  W if  $n > 0$  (0 if  $n = 0$ )  $\rightarrow x - 1 + (n+1 - (n+1) \% 2) / 2$  B

n = 1

Now:  $(n+1 - (n+1) \% 2) / 2$  W if  $n > 1$  (0 if  $n = 1$ )  $\rightarrow x + (n-1 - (n-1) \% 2) / 2$  B

Later:  $(n - n \% 2) / 2$  W  $\rightarrow x + (n - n \% 2) / 2$  B

n = 0

Now:  $x - 1 + (n+2 - (n+2) \% 2) / 2$  W if  $n > 0$  ( $x - 1$  if  $n = 0$ )  $\rightarrow (n+1 - (n+1) \% 2) / 2$  B

Later:  $x - 1 + (n+1 - (n+1) \% 2) / 2$  W  $\rightarrow (n+2 - (n+2) \% 2) / 2$  B if  $n > 0$  (0 if  $n = 0$ )

The difference between stepping up and right still remains in these vertical expansion cases. We didn't have to deal with it at the small area, because the line could not step backwards.

It just means we have to remove the Now W conditions for stepping right.

Figure 1 consists of two 10x10 grids. The left grid shows a black shape on a white background. The shape is defined by a thick black outline and contains several black squares. The right grid shows the same shape on a red background. The shape is defined by a thick red outline and contains several gray squares. The grids are used to illustrate the generation of a complex shape from a set of points.

Now when there is a C-Shape, it is possible to step there, and no other rules will be checked. But C-Shape is just one of the nine cases of area checking.

A 5x5 grid world diagram. The robot is at (1,2) with a green arrow pointing right. A red 'X' obstacle is at (3,3). Actions are indicated by arrows: left arrow at (1,1), right arrow at (1,5), up arrow at (2,2), down arrow at (2,4), left arrow at (3,2), right arrow at (3,4), and a vertical bar at (4,3).

An unusable algorithm would require a number of operations on the order of  $2^n$  or more: that is the random path where you just guess the next step until you get an impossible situation, but the crossroad might have been as far back as almost  $n \times n$  steps.)

107 108

Notice the area is the same as with the case where the obstacle is one field to the right, but there is a difference:

Look at the 3-distance case. Since the obstacle is straight ahead, if we enter now by stepping left, we cannot exit at the black field, because then one of the whites could not have been filled.

The area can only be filled if it is 1W. (This is the case we previously called Double C-Shape.) Adding 4 extra distance does not make the problem disappear: if we exit at the first black and the previous field was the first white, now we get the 5-distance case with 3 white fields and 2 black. A black to black line is therefore not possible.

These are the new values:

$D \% 4 = 3$ :

Now:  $1W \rightarrow -1B = (D+1)/4$   $W \rightarrow (D-7)/4$  B

Later:  $1W \rightarrow 0B = (D+1)/4$   $W \rightarrow (D-3)/4$  B  
(single rule)

$D \% 4 = 5$ :

Now:  $2W \rightarrow 0B = (D+3)/4$   $W \rightarrow (D-5)/4$  B

Later:  $1W \rightarrow 0B = (D-1)/4$   $W \rightarrow (D-5)/4$  B  
(single rule)

Also, pay attention to the 2-distance case. If we enter now by stepping left, 1W is possible. If we step straight, it is 0W. When the distance is 6, there is no difference, because if the step straight, we can exit the area immediately.

Side straight cases, small area:

Big area:

And here is an example of the x horizontal, 0 vertical distance big area corner. None of the existing cases cover it. The area is impair, so we shouldn't be able to step right.

When we re-run the program on 9 x 9, it will be obvious that covering all the above 9 cases of area checking still does not solve everything.

If we don't apply the first size-specific rule, we get stuck here:

As a reminder:

Let's put this into the perspective of our current knowledge.

What happens here is that the 3 x 2 area has a certain exit point, the middle, because the area is pair. Then it will create a C-Shape on one side and an area on the other side with a 1-wide gap.

In general, if we have an area of this shape,

that consists equal amount of black and white fields, and we enter now, we will exit at the black field, and the preceding field could only have been the farthest corner white, and we can continue backwards through all corner whites like this:

The whole process is then repeated, increasing the vertical distance, until a non-empty field is found at  $n$  horizontal and  $n + 1$  vertical distance.

You could make the process more bulletproof by including the across obstacles at the corner points or the straight obstacle at the top, but is it necessary? It is not proven until we have a case for them.

The figure consists of two 10x10 grids. In the left grid, a black line starts at the top-left corner, moves right, then down, then left, and then down again, forming a partial square. A small red region is located in the top-right corner. In the right grid, the black line has expanded to cover more of the grid, and the red region has also expanded, now covering a larger area in the top-right corner.

Previously, we represented it like this:

Per our expectation, the program stops at the next double area case.

What is common in these rules?

There is an area with a straight border line of maximum 3 fields, with the obstacle being in the upper left corner. The farthest border field cannot be the exit, the line needs to go downwards from it, but another area is created with one of the obstacles on the up side.

The live end can be in 3 different positions in relation to the area. All patterns can be rotated clockwise, but the first can also be rotated counter-clockwise, shown in the fourth picture.

When exiting the area, we check for mid across and across obstacles on the left side. Why can C-shape checking be omitted? It is already solved by the single area universal rules.

And the left forbidden field in the first rule is already disabled too.

Take a better look at the third.  
The reason the line is not exiting from the corner is that there is one more black field than white:

So far, we simply assumed that it is the opposite, just because the area is impair, but such case does not exist. Because of the single area rule with the obstacle, the step to get there is disabled. In the following example the desired area is 1B. So is the area defined by the obstacle.

When checking the conditions for the first area, these are the fields that need to be empty:

Notice that the first two cases can exist simultaneously. Then we examine the smaller area (second case); the obstacle in the first will create a C-shape with the exit of that area and the leftwards step will be disabled by the single area rule:

Can the border line be longer?

If we look at 4 distance: It is true that if the area is 1W and we step forward, only one white field remains on the border, but we can also exit immediately, leaving a 3-long border line and a 0W area. Then, the area can be entered at the second white and exited at the last black.

The next step is similar in concept (Square 4 x 2 C-Shape and Square 4 x 2 Area): When we exit the first area, there are two close obstacles on either side:

The pattern is rotated counter-clockwise.

We can see that the mechanism is not limited to a few cases, but it can go on indefinitely. If after exiting the area, there are repeated C-shapes on the left side (a stair shape), the right side obstacle may be far away, as in this example:

A sequence is made from the start area and the close obstacle cases, and this can be programmed. But let's build the program step by step, based on the discovered 9 x 9 rules. The second case, Triple Area, uses an area where the obstacle is 3 distance away.

If the area is pair, the exit field will be straight in the middle, and the next step is one to the right. That's where we can check for close obstacles on either side. Stepping to the left is already disabled in the single area straight obstacle rule. Otherwise, the pattern is rotated, like in the previous case.

	←	↔	→	↑		
	→	A	B		+	
	<del>↔</del>			C		+
<del>×</del>						
		+				

We do not code the 4 steps in the program. We are writing a recursive function that calls itself until it runs into the double obstacle case. Notice, the start area is the same as in Square 4 x 2 C-Shape and Square 4 x 2 Area. So these are also solved by this algorithm.

		+		
	+			
←				
↖				
→	×	→	↗	↓
	—			

Accordingly, there will be 3 ways the rule is rotated.

We get stuck at 641 027 in a case that was previously solved with Double C-Shape.

If we didn't have the taken field marked with A, the straight obstacle rule would rightfully disable the left field.

But, since we want to keep the field next to the furthest border field empty, we need to apply a rule for the smaller area. This will be the same as in the 0 horizontal distance small area case.

Now, take a look at the following two cases. The first is the well-known Triple Area Exit Down, at over 18 million, while the other comes at around 51 million.

In the first, we can only step left. In the second, we cannot step left. It is easy to see that the pattern can be longer. If there is a stair shape downwards with 3 fields at the bottom, there will be a stair backwards, which conflicts with the obstacle on the left (D). But there are more things that need to be present:

- There should be an obstacle at 2 distance straight ahead to start with.
- If the B and C weren't taken, the area could be filled.

What is the simplest algorithm to apply?

In the following, I check these fields as empty, taken or directional taken.

The area enclosed with red line is repeated downwards left, until both of the fields are taken.

For each return step, I check a mid across directional field. Their right and down field need to be empty as well.

Why is C-shape checking to the left unnecessary? It is already taken care of.

To accomodate the Triple Area Exit Down case, let's first check the presence of an obstacle straight ahead at 3 vertical distance. Stepping one forward, we can apply the same procedure.
